Security and Infrastructure Whitepaper v6

SAMPLE CONTENT: synthetic, not real Azentio data. Fictional product for demonstration only.

Document date: 2026-03-25 | Product version: 6.2

1. Hosting

MIBS SaaS runs on AWS in dedicated single-tenant environments for each customer.

2. Data residency

Customer data stays in the contracted region. Generally available regions are AWS ap-south-1 (Mumbai) for India and AWS eu-central-1 (Frankfurt) for the EU. Production data, backups and replicas stay inside the contracted residency boundary.

3. Encryption

Data at rest is encrypted with AES-256 using AWS KMS. Customer-managed keys are optional. Data in transit uses TLS 1.2 or higher, and TLS 1.3 is supported. Service-to-service traffic uses mutual TLS.

4. Identity and access

Single sign-on is available through SAML 2.0 and OIDC. Multi-factor authentication and role-based access with maker-checker are standard. Vendor staff access to production data uses just-in-time privileged access that requires customer approval and is session-recorded.

5. Logging and monitoring

Logs are centralised and retained for 13 months, with 90 days immediately searchable. SIEM integration is supported, and security monitoring runs 24x7.

6. Vulnerability management and development

Vulnerability scans run monthly. The secure development lifecycle includes SAST, DAST and dependency scanning. For current certification status refer to the Certifications and Attestations Register.
