# Shariah Governance and Compliance Guide v6.2

*SAMPLE CONTENT: synthetic, not real Azentio data. Fictional product for demonstration only.*

Document date: 2026-03-15 | Product version: 6.2

## 1. Shariah rule engine

Product rules are configured from the fatwa that approves the product. Contract templates are versioned and approved. A rule violation blocks the transaction or raises an exception for review.

## 2. Product approval workflow

A new product or a change request goes to the Shariah Supervisory Board (SSB) through a maker-checker workflow. The SSB approval is recorded with the fatwa reference and effective date. Approved products are version-locked, so a change cannot be applied without a fresh approval.

## 3. Fatwa repository

Resolutions are held in a searchable repository linked to the products they approve.

## 4. Non-compliant income and purification

Income identified as not Shariah-compliant, such as late-payment amounts above cost recovery, is segregated into a charity account. The purification workflow tracks disbursement to approved charities and produces reports.

## 5. Shariah audit

An immutable audit trail records every Shariah-relevant action. Exception reports and exports support internal Shariah audit and external review.

## 6. Standards

Rules are configurable to the standards the institution adopts, including AAOIFI, IFSB and the central bank's Shariah governance framework.
